Hi Richard and Joe,

This is an excellent paper.

I have had a first go. In some places the language does need to be harmonised a little. In particular, be clear about what the 3-4 big results are, and try to ensure there is one figure for each point if possible. One figure per point.

1. These three risks can be incorporated and you can get 30% of the range of every species in less than 30% of the globe – the map with all risks included
2. There are some areas of protection prioritisation that represent no regrets options
3. Including risks has a large impact on the priorities of some countries, especially if there are adjacent to countries with very different levels of governance
4. From 3 – countries with highly effective governance close to countries with less effective governance (and hence high risk of protected area degradation) may need to bear more of the global conservation responsibility

Cheers

Hugh

Thanks Richard - I will be able to get on to it this weekend. Much appreciated.

Google drive doesn't always work that well for me as I travel - so if you can email a word version even better

Hi Hugh,

I hope this message finds you well.

Joe Bennett mentioned that you might have some time to have a look at our global risk paper:
<https://drive.google.com/file/d/14j9bfhM4oOoPPHlwBTr7QA3mdWxmpW7Z/view?usp=sharing>

Any and all feedback would be much appreciated.
Joe flagged a few places for you re: approach and what you think about it.

Thanks,
Richard
